

Fyndbridge ATS User Manual

Dashboard, Candidates, Clients, Mandates, Profile Settings, and Notifications

Introduction

Fyndbridge ATS is a recruiter-facing workspace for managing hiring pipelines and client development. This PDF covers the end-user behavior visible in Dashboard, Candidates, Clients, Mandates, Profile Settings, and notification-related topbar features.

Core navigation

The sidebar provides Dashboard, Mandates, Clients, Candidates, and Profile access. The topbar shows the page title, breadcrumb, today's date, the notification bell, and the current user chip that opens Profile Settings.

Common UI patterns

Across list pages, the app uses a New dropdown, AI Filter, Sort By, table column controls, Proceed to apply column visibility, Save Preference to persist those columns, Reset to Saved Preference, inline status badges, modal forms, and realtime refresh.

Dashboard

The dashboard is the live analytics and drilldown workspace. It includes consultant filtering, period filtering, KPI cards, status donuts, trend charts, online presence visibility, and recent activity.

Dashboard metrics

The three KPI cards are Total Clients, Total Candidates, and Total Mandates. Each KPI card has a sparkline preview and can open a larger modal view.

How dashboard metrics open specific things

Status donuts and status lists are clickable. Clicking a segment or row opens a drilldown modal filtered by module, consultant, status, and period. From there, Open full page takes the user to the corresponding filtered list page, such as Candidates or Mandates.

Dashboard sections

Mandates Analytics shows mandates by Ongoing, Completed, and Scrapped, plus Mandates Trend. Candidates Analytics shows candidate status distribution and Candidate Movement Trend. Clients Analytics shows client status distribution, Client Acquisition Trend, and signed-contract billing entity cards.

Recent Activity

Recent Activity lists the latest client, candidate, and mandate changes. View all opens a larger modal with more activity rows.

Online, Away, and Offline metrics

The dashboard presence strip shows Online and Away counts and avatars. Users are marked Online when the tab is visible and focused, and Away when the app tab is open but not actively focused. Offline is written when the tab leaves, but Offline is not displayed as a separate dashboard metric card or count in the current UI.

Candidates

The Candidates module manages manual candidate creation, bulk resume parsing, duplicate handling, client/mandate assignment, inline status updates, and saved column preferences.

Add Candidate fields

Field	Required / Optional	Notes
Full Name	Required	Must not be blank
Mobile	Required	Used in duplicate checks along with email
Client	Required	Must be selected from a valid dropdown choice
Mandate	Required	Must be selected from a valid dropdown choice
Email	Optional but recommended	Useful for duplicate detection and communication
Designation	Optional	Current designation
Current Organisation	Optional	Organisation/company field
Experience	Optional	Stored as years
Current CTC	Optional	Displayed as compensation text
Expected CTC	Optional	Displayed as compensation text
Notice Period	Optional	Numeric days
Open to Relocate	Optional	Yes/No dropdown
Skills / Education	Optional	Manual or parsed data
Status	Optional	Can also be updated inline from the table
Offered CTC / Date of Joining	Conditional	Relevant when status is Hired
CV Upload	Recommended	Use the actual file when you have it
CV Link	Optional	Only add a CV link when you only have a URL and do not have the actual file
LinkedIn / Notes	Optional	External profile plus internal notes

Candidate table and columns

The Candidates table can show Candidate ID, Date, Consultant, Client Name, Client ID, Job ID, Role, Candidate Name, Organisation, Designation, Mobile, Email ID, Experience, Skills, Current CTC, Notice Period, Expected CTC, Open to Relocate, Comments, LinkedIn, Status, Offered CTC, Date of Joining, CV, Month, and Action.

Column workflow

Columns opens the column picker. Select All and Clear All change the pending selection. Proceed applies the currently pending columns to the visible table immediately. Save Preference stores the chosen columns to user preferences and local storage. Reset to Saved Preference restores the last saved set.

AI Filter and sorting

Candidate AI Filter supports natural-language filtering across candidate ID, candidate name, consultant, job ID, email, mobile, designation, organisation, experience, skills, client ID, client name, role, date, current CTC, expected CTC, offered CTC, date of joining, current location, notice period, open to relocate, comments, status, month, LinkedIn, and CV. Mandate dropdown filtering and Sort By are available alongside it.

Assign Another Mandate/Client button

The Candidates module manages manual candidate creation, bulk resume parsing, duplicate handling, client/mandate assignment, inline status updates, and saved column preferences.

When editing an existing candidate, the modal footer shows **Assign Another Mandate/Client**. This opens the candidate form in assignment mode and creates a new assignment instead of overwriting the current candidate row. The banner explicitly states that the current candidate row will not be changed.

Candidate Flowchart

New -> Add candidate -> Fill candidate details -> Select valid Client -> Select valid Mandate -> Save Candidate

Photographic Step-by-Step

The screenshots below demonstrate the complete Add Candidate workflow, from opening the creation menu to entering skills and saving the candidate record.

1. Click New from the Candidates page.

2. Select Add candidate from the available actions.

3. Complete the candidate profile with the required and supporting details. 4. Type the skill name and click Add to include it in the candidate profile.

5. Review the completed form and click Save Candidate.

Clients

The Clients module manages organizations, client contacts, follow-up dates, business-development statuses, and commercial details used throughout the recruiting workflow.

Client Flowchart

New -> Add client -> Choose Add New Client -> Fill client details -> Save Client

Photographic Step-by-Step

The screenshots below demonstrate the complete Add Client workflow, from opening the action menu to selecting Add New Client, completing the client form, and saving the new client record.

1. Click New from the Clients page.

2. Select Add client from the available actions.

3. Choose Add New Client from the client name dropdown.

4. Complete the client form with the required business and contact details.

5. Review the form and click Save Client.

Mandates

The Mandates module manages client-linked openings, consultants, team leads, budgets, sectors, allocation dates, and JD uploads used throughout the hiring workflow.

Mandate Flowchart

New -> Add mandate -> Fill mandate details -> Choose Add New Role -> Save Mandate

Photographic Step-by-Step

The screenshots below demonstrate the complete Add Mandate workflow, from opening the action menu to choosing Add New Role, completing the form, and saving the mandate record.

1. Click New from the Mandates page.

2. Select Add mandate from the available actions.

3. Complete the mandate form and choose Add New Role from the role dropdown.

4. Review the form and click Save Mandate.

Profile Settings

Profile Settings is opened from the topbar user chip. The page loads the current user profile, allows edits, and saves them back through the user-profiles API.

Profile fields

The form includes Name, Email, Gender, Blood Group, PAN, Mobile Number, and Emergency Mobile Number. Email is read-only. Save Profile is enabled only when the tracked editable fields differ from the original profile.

Profile save behavior

On save, the page posts the profile, refreshes the profile cache, updates the session-stored display name, dispatches a profile-name-updated event, and shows a small Profile saved confirmation popup.

Notifications

The notification bell lives in the topbar. It loads notifications, listens for realtime notification inserts and updates, and shows a pending-count badge.

Notification statuses and actions

Notifications are displayed with either Pending or Read status. Pending items show a Mark as Read button. Read items show the read timestamp. The dropdown header includes Clear All, which clears the current read-notification set through the notifications-read delete endpoint. The notification toast can also show a Mark as Read action for pending items.

Follow-up notifications

Client follow-up notifications that are due today are the key user-facing notification type in this scope. These can appear in the dropdown and as temporary toast alerts.

Summary

Use Dashboard for analytics and drilldowns, Candidates for manual entry and resume parsing, Clients for organization and follow-up tracking, Mandates for job opening control, Profile Settings for personal details, and the Notification Bell for pending follow-up actions. Column preferences, AI Filter, and inline status controls are part of the core productivity workflow across the app.

Generated from repository inspection on 30 June 2026. This PDF is a standalone artifact outside the repository.

Assign Another Mandate to an Existing Candidate

The system does not allow duplicate candidate creation for the same profile. When an existing candidate needs to be mapped to an additional client or mandate, use the assignment workflow instead of creating a duplicate candidate record.

Assignment Flowchart

Candidates page -> Edit candidate -> Assign Another Mandate/Client -> Select the new client and mandate -> Save New Assignment

Photographic Step-by-Step

The screenshots below demonstrate how to assign an already added candidate to another mandate while preserving the existing candidate record and avoiding duplicate entries.

1. Open the Candidates page and locate the existing candidate record.

2. Click the pencil icon in the Action column to edit the candidate.

3. Click Assign Another Mandate/Client in the candidate form.

4. Select the new client and mandate from the dropdowns, then click Save New Assignment.
